Leonardo da Vinci (Japanese Edition)

A brief biography of this individual is provided below.
Key Areas of Activity and Research

* Arts and Fine Arts: Painting (e.g., *Mona Lisa*, *The Last Supper*), sculpture, and architecture.
* Natural and Basic Sciences: Mathematics, physics, chemistry, optics, astronomy, geology, botany, and zoology.
* Medicine and Biology: Anatomy (conducted dissections of over 30 bodies, producing detailed depictions of human anatomical structures, muscles, and internal organs).
* Engineering and Technology: Civil engineering (design of bridges and canals), fluid dynamics, mechanical engineering, and military engineering.
(Conceptualized inventions such as flying machines and tanks.)
* Other: Music, philosophy, and literature. [1, 2, 3, 4, 5, 6, 7]

Incidentally, Inō Tadataka also created a map of Japan by traveling across the country—all after the age of 50.
(The resulting map is nearly identical to modern-day maps of Japan, with only a negligible margin of error.)
(Note: He did this without a tape measure; instead, he precisely determined the length of his own stride and used that to map the entire country—including Hokkaido.)

By the way, I happened to come across an incredible 64-year-old man on YouTube. He's supposedly a martial artist, and his daily training regimen is absolutely intense—he even jumps up stone stairs, taking them two at a time, without ever getting winded. Personally, I don't do that; I'd hate to trip and end up getting hurt.

Incidentally—and this is just my own personal theory—
it is possible that individuals who consume tobacco or alcohol have a lower desire to change jobs compared to those who do not.
*** My hypothesis is that this may be linked to whether or not one is tied to such habits.**
*** This is based on a comparison with countries in the United States and Europe,**
in terms of smoking and drinking rates.
